

# Single Package HVAC

A package system, like Magic-Pak, is a single unit package containing both a heating and cooling system. The systems must be installed in each unit and have natural gas and/or electricity distributed to them. Systems can use gas or heat pumps for space heating.

## Pros & Cons

Packaged systems can be easier to install than central systems and do not require a mechanical room. They must be located on the exterior walls of each unit and each one has a louver on the outside of the building for both air supply and combustion exhaust.

System	Capital Cost	Energy Cost	Suite Noise	Floor Space Impacted	Submetering	Fuel Flexibility	Temperature Control
Single Package	Moderate	Moderate	High	Each Unit	Inexpensive	Low-Medium	Unknown
